

 Delta CENTERPIPE AND OUTER BASKET Screens

GIVE FLOW RATES A BOOST.

Centerpipes from Delta Screens are ideal for use in radial flow systems where high volume flow with minimal pressure drop is desired. When used in a downflow system, the process flow moves through the outer basket, across the media and is collected in the center screen. In upflow systems the flow is reversed. Our continuous slot design resists plugging to provide reliable media retention with less maintenance. Precision welded for superior strength and long-lasting durability, our centerpipes offer years of efficient and consistent flow rates. Delta Screens can manufacture centerpipes to suit your application in a wide variety of materials and sizes.

For dependable media retention in radial flow systems.
